

PIRIMI

Reducing Food Waste Through a Local, Realistic Digital Platform (Algeria)

1. Project Summary

PIRIMI is a digital platform designed to reduce **food waste** in Algeria by connecting:

- **Stores** with near-expiry food products
- **Consumers** looking for affordable prices
- **Associations** that can receive food donations

The platform is designed with **Algerian market realities** in mind: cash payments, low digital maturity, trust issues, and limited logistics infrastructure.

2. The Problem (Algeria Context)

Food waste in Algeria is high, while:

- Purchasing power is decreasing
- Food prices are unstable
- Donations are informal and untracked

Key issues:

- Stores throw away products close to expiry
- Consumers lack access to discounted food
- Associations depend on informal networks
- No structured, digital, trusted solution exists

Most current solutions are:

- Offline
 - Manual
 - Fragmented (Facebook groups, word of mouth)
-

3. Why Existing Global Solutions Don't Work in Algeria

Apps like *Too Good To Go* work in Europe because of:

- Strong logistics
- Online payments
- High trust in digital platforms

In Algeria, challenges include:

- Cash-based economy
- Limited delivery services
- Low adoption of complex apps
- Trust and food safety concerns

PIRIMI is designed specifically for this context.

4. How PIRIMI Works (Real-Life Flow)

4.1 For Stores

1. Store creates an account
2. Lists food products close to expiry
3. Chooses: **sell at discount** or **donate**
4. Receives reservations from users
5. Hands products **in-store** (no delivery at MVP stage)

4.2 For Consumers

1. User browses nearby offers
2. Reserves a product via the app
3. Pays **cash on pickup**
4. Saves money while reducing waste

4.3 For Associations

1. Verified association joins platform
2. Views available donations
3. Reserves and collects food
4. Donation history is recorded

5. Key Design Decisions (Algeria-First)

- **Food only** (build trust first)
- **One city launch** (pilot)
- **No delivery initially** (reduce complexity)
- **Cash payment** supported
- **Manual verification** of partners at early stage

These choices reduce risk and increase adoption.

6. MVP Scope

The first version (MVP) includes:

- Mobile-friendly web app
- Consumer dashboard
- Store dashboard
- Association access
- Admin moderation panel
- Mock analytics (impact tracking)

Out of scope for MVP:

- Online payments
 - Nationwide coverage
 - Advanced automation
-

7. Impact

Economic Impact

- Reduced losses for stores
- Cheaper food for consumers

Social Impact

- Structured food donations
- Support for vulnerable families

Environmental Impact

- Less food waste
 - Better resource usage
-

8. Scalability & Vision

After validation:

- Expand to other cities
 - Add more food categories
 - Introduce delivery partnerships
 - Integrate analytics for stores
 - Extend to other product categories (future)
-

9. Why PIRIMI Is Realistic

- Designed by understanding **local constraints**

- Focused MVP (no over-engineering)
- Frontend-first validation
- Strong social impact narrative

PIRIMI is not copying foreign models — it adapts them to Algeria.

10. Current Status

- Concept validated
 - Frontend MVP in progress
 - Open to feedback, partnerships, and incubation
-
